Tutorial: Real-time Object Detection with YOLO

In this tutorial, you will learn how to use the YOLOv26 model with OpenCV to automatically detect and draw bounding boxes around objects in an image.

Step 1: Install Required Packages

Install the necessary packages including OpenCV and other dependencies:

In [1]:
```
%pip install --upgrade ultralytics
%pip install opencv-python
%pip install matplotlib
%pip install numpy==1.26.4 --force-reinstall
```

```

Required-by:
Note: you may need to restart the kernel to use updated packages.
```

Step 2: Import Required Libraries

Import the libraries you will use:

In [3]:
```
import numpy as np
import math
import cv2
from ultralytics import YOLO
from matplotlib import pyplot as plt
```

```
Creating new Ultralytics Settings v0.0.6 file
View Ultralytics Settings with 'yolo settings' or at 'C:\Users\ASUS VIVOBOOK PRO
\AppData\Roaming\Ultralytics\settings.json'
Update Settings with 'yolo settings key=value', i.e. 'yolo settings runs_dir=pat
h/to/dir'. For help see https://docs.ultralytics.com/quickstart/#ultralytics-sett
ings.
```

Step 3: Load the YOLOv26 Model

Load the pre-trained YOLOv26 model (automatically downloads if not available):

In [5]:
```
# Load a pretrained YOLO model version 26, nano (n) size
model = YOLO('yolo26n.pt')  # Using nano version for speed, other options: yolov
```

```
Downloading https://github.com/ultralytics/assets/releases/download/v8.4.0/yolo26
n.pt to 'yolo26n.pt': 100% ━━━━━━━━━━━━ 5.3MB 12.7MB/s 0.4s3s<0.4s0.6ss
```

In [6]:
```
# Show class names the model can detect
model.names
```

Step 4.1: Run YOLO on an Image

In [7]:
```
from ultralytics import YOLO

# Load a pretrained YOLO26n model
model = YOLO("yolo26n.pt")

# Define path to the image file
source = r"semana3\img1.png"

(1, 3, 480, 640)
```

Step 4.2: Run YOLO on an Image + save result in working directory + plot with matplotlib

In [9]:
```
from ultralytics import YOLO
import matplotlib.pyplot as plt
import cv2

# Cargar modelo
model = YOLO("yolo26n.pt")

Step 5.2: Run YOLO on your webcam video

Option 1: Simple

In [22]:
```python
from ultralytics import YOLO

# Load a pretrained YOLO26n model
model = YOLO("yolo26n.pt")

# Run inference on the source
results = model(source=0, show=True)
```

```
1/1: 0... Success  (inf frames of shape 640x480 at 30.00 FPS)

WARNING
Inference results will accumulate in RAM unless `stream=True` is passed, which ca
n cause out-of-memory errors for large
sources or long-running streams and videos. See https://docs.ultralytics.com/mode
s/predict/ for help.

Example:
    results = model(source=..., stream=True)  # generator of Results objects
    for r in results:
        boxes = r.boxes  # Boxes object for bbox outputs
        masks = r.masks  # Masks object for segment masks outputs
        probs = r.probs  # Class probabilities for classification outputs

Inference results will accumulate in RAM unless `stream=True` is passed, which ca

Activity

In this activity, the work will be developed **locally on your personal computers**.

Objective

Design a **specific object detection application** using YOLO (You Only Look Once), focused on **a limited subset of classes**. The system must show that **it only detects the**

activated classes, visually ignoring objects belonging to deactivated classes (even if they are present in the image).

Instructions

1. **Define a concrete application and the problem it solves**, for example: vehicle detection, fruits detection, etc.
2. **Select between 2 and 4 classes** from the YOLO model to detect.
3. **Modify the model logic** or post-processing so that **only the selected classes are shown**.
4. Run the application on video where **objects from non-activated classes** are also present to demonstrate that the system **ignores those classes**.
5. Show the results clearly, visually indicating the detected and non-detected objects.

Deliverable

Must be uploaded to the virtual classroom:

- **Jupyter Notebook in PDF format** containing:
- Commented code
- Application title and the problem it solves
- List of activated classes
- Screenshots or test images with results showing:
  - Objects *correctly detected* according to the activated classes. At least two objects should be detected at the same time.
  - Objects *not detected* because they belong to deactivated classes (even if present in the image).

Grading Rubric

Criteria	Points	Description
1. Application Definition and Problem Statement	4	Clearly defines a specific object detection application (using only the activated classes) and its practical use case.
2. Implementation	2	Successfully modifies the model logic or post-processing to only show selected classes. Code is functional and properly ignores non-selected classes. The new code added should be commented/documented.
3. Testing & Evidence	4	Provides a clear test showing both detected (activated classes) and ignored (deactivated classes) objects. Evidence demonstrates the

Sistema de detección de basura para monitoreo domiciliario con alerta automática

En las zonas residenciales, existen personas que arrojan o dejan basura en lugares no permitidos como fuera de otras casas, esquinas o zonas con áreas verdes, que genera

molestias a las personas cercanas a estos lugares aparte del daño ambiental y sanitario, que puede atraer plagas y no da buena imagen al lugar.

En este caso se plantea que los objetos o clases a detectar sean personas, autos y basura.

Evento 2

Evento 3

Evento 4

Como se puede ver en las imagenes es posible detectar los objetos de interes que en este caso son personas dejando basura fuera de casas en lugares residenciales.
